

Sprint 1 Use Case

Title: Adding Augur Documentation

Description

When users are attempting to use or deploy Augur, documentation is needed in order to assist the user. This documentation should allow any user interested in deploying an instance or utilizing an already deployed instance of Augur to fully understand the process necessary and should be the only source needed to do so.

Triggers

1. User gains interest in Augur
2. A user runs into a problem while using Augur

Actors

1. Users looking to deploy Augur.
2. Users of a deployed instance.

Preconditions

1. User has a compatible system on which to deploy and access Augur.

Main Success Scenarios (Goals)

1. A user is able to successfully deploy and utilize Augur through sufficient documentation

Alternate Success Scenarios

1. A user is able to successfully deploy and utilize Augur though documentation was confusing and or insufficient to grant a full understanding of the system

Failed End Condition

1. A user is unable to deploy or utilize Augur due to insufficient documentation

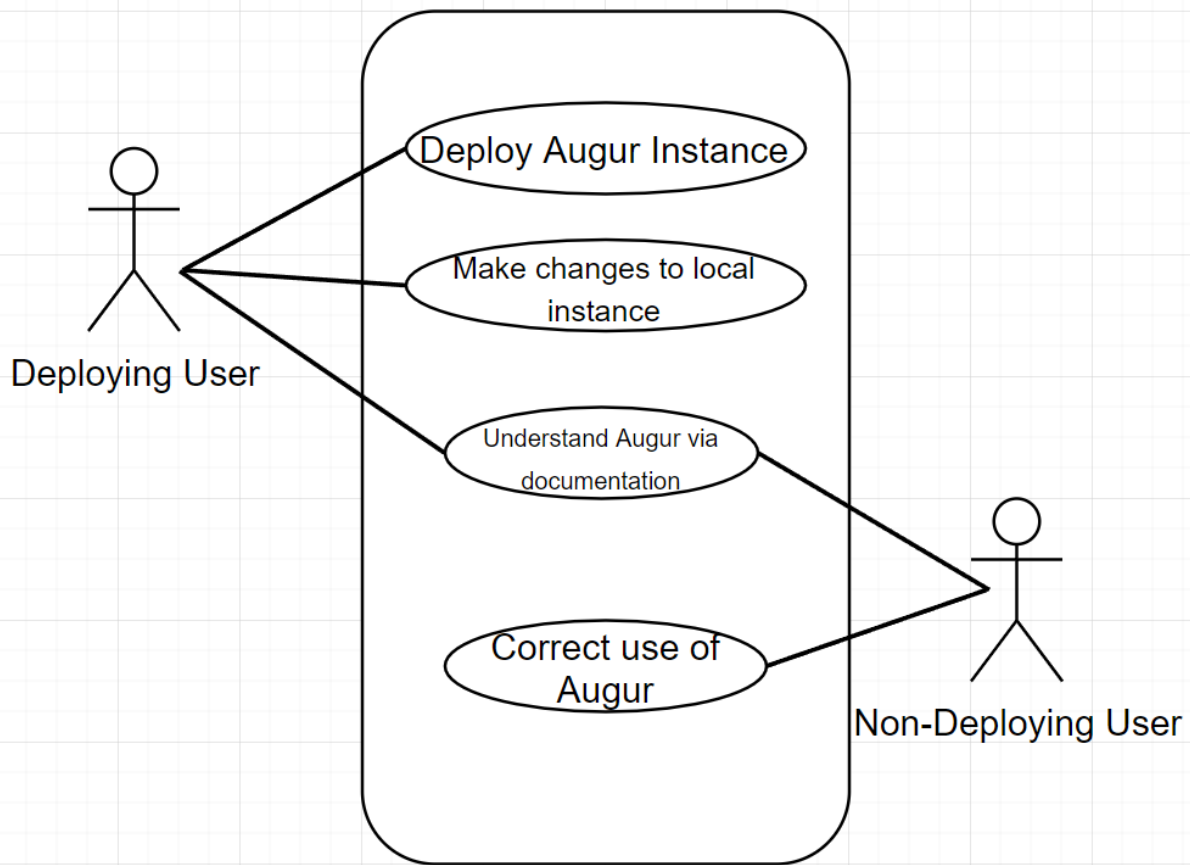

Extensions

1. A user will be redirected if proper documentation has already been written by another source in a well constructed manner, and then directed to return to our documentation at a separate point.

Steps of Execution (Requirements)

1. Determine areas of insufficient documentation through personal experience or github issues.
2. Research and find proper solution to areas with insufficient documentation
3. Implement proper documentation
4. Analyze user testing to determine if documentation is sufficient
